Project Title:

PodCraft - Agentic AI Podcast Episode Planning System

Project Category (Major Domains):

B - Web Application / Web Application based Information System
C - Problem Solving and Artificial Intelligence
E - Smartphone Application
Other: Agentic Artificial Intelligence System

Abstract

PodCraft is developed to simplify and automate podcast episode planning using intelligent autonomous agents.

Currently, podcasters rely heavily on manual research, scattered online sources, and unstructured planning methods, which consume significant time and often reduce content quality.

Many creators struggle to organize episode flow, prepare engaging questions, and design strong introductions that retain audience attention. This leads to inconsistent production quality and inefficient preparation workflows.

There is no unified intelligent platform that autonomously plans podcast episodes based on niche and guest information.

PodCraft addresses this gap by using autonomous agents to research topics, generate structured questions, create engaging hooks, and design complete episode outlines. The system aims to automate preparation, improve episode structure, and assist creators in producing professional content efficiently. It also enhances time management by providing timestamped segments and guided content flow.

The project ultimately enables podcasters to focus more on creativity and delivery rather than planning logistics. PodCraft improves productivity and raises the overall quality of podcast production through intelligent automation.

1. Introduction

This project proposal document presents the design and development scope of PodCraft, an agentic artificial intelligence system for podcast episode planning. The purpose of this project is to develop a smart platform that assists podcasters in preparing structured and engaging episodes with minimal manual effort. Podcasting has grown rapidly as a medium for education, entertainment, and professional communication across the world. However, planning a podcast episode requires extensive research, structured thinking, and careful time management. Many content creators struggle with organizing discussion flow, preparing meaningful questions, and designing engaging introductions. The process becomes more difficult when inviting guests from specialized fields, as hosts must understand the guest's background and audience interests. Existing tools only provide basic note-taking or script-writing features but lack intelligent automation and planning support. Modern artificial intelligence systems now enable autonomous decision-making and content generation through agent-based architectures. PodCraft utilizes this technology to provide intelligent research, content planning, and episode structuring support. The system operates through specialized agents that collaborate to produce a complete episode plan. These agents analyze user intent, research relevant topics, generate interview questions, suggest engaging hooks, and organize content flow. The proposed system aims to modernize podcast planning by combining artificial intelligence automation with creative assistance.

2. Problem Statement

Podcast content creators spend a significant amount of time researching topics, analyzing guest backgrounds, and structuring episode flow before recording. This preparation process is often unorganized and depends heavily on manual internet searches, personal notes, and scattered digital tools. Creators frequently struggle to identify trending and relevant topics that match their podcast niche. Preparing meaningful and engaging interview questions requires deep understanding of the guest's expertise and audience expectations. Many podcasters also face difficulty in organizing episode segments and managing time distribution effectively. As a result, episodes may become inconsistent, poorly structured, or less engaging for listeners. Creating attractive introductions and hooks is another challenge that directly affects audience retention. Current podcast planning tools mainly offer simple text editing or script writing features but lack intelligent research and automated structuring capabilities. There is no integrated system that autonomously converts a podcast idea into a complete episode plan. The absence of intelligent planning support increases workload and reduces creative efficiency. This problem becomes more significant for independent creators and small production teams with limited resources. Additionally, inefficient planning leads to longer preparation time and delays in publishing schedules. The growing demand for high-quality content makes manual planning methods insufficient. Therefore, an intelligent automated system is required to simplify podcast episode preparation and improve production efficiency.

3. Problem Solution / Objectives of the Proposed System

The proposed system, PodCraft, introduces an intelligent agent-based platform that automates podcast episode planning. The system allows users to provide their podcast niche or guest information as input. A User Intent and Guest Analyzer agent interprets this input to determine content direction and audience expectations. A Topic Research Agent collects relevant themes, trending discussions, and important background information related to the niche or guest. The Question and Timestamp Generator agent produces structured interview questions and assigns estimated time durations for each segment. A Hook and Intro Suggestion Agent generates engaging opening statements designed to capture listener attention.

The Episode Outline Planner agent organizes all generated content into a logical and smooth episode structure. This integrated workflow reduces manual effort and improves planning efficiency. The system ensures that episodes follow a professional structure with balanced content distribution. Intelligent automation allows creators to focus more on presentation skills and creativity. The platform also improves consistency in episode quality across different productions. PodCraft supports both web and smartphone platforms for flexible accessibility. The system is designed with a user-friendly interface to support both beginner and professional podcasters. Overall, the proposed solution enhances productivity, reduces preparation time, and improves content organization through artificial intelligence automation.

3.1 Objectives

BO-1: Reduce podcast episode planning time by at least 50%.
BO-2: Improve episode content structure and organization quality by 40%.
BO-3: Increase audience engagement through improved hooks and structured discussions.
BO-4: Automate topic research and question generation to reduce manual workload.
BO-5: Provide an integrated platform for podcast planning across web and smartphone devices.

4. Related System Analysis / Literature Review

The reviewed systems provide support in editing, hosting, note organization, or general content generation, but none offer a complete intelligent podcast episode planning solution. Existing tools either focus on post-production, publishing, or manual organization rather than automated preparation. They lack collaborative autonomous agents that can research topics, analyze guests, generate structured questions, design engaging hooks, and organize episode flow in a single workflow. These limitations highlight the need for an integrated agentic system like PodCraft that automates podcast planning from idea to structured episode outline.

Table 1Related System Analysis with Proposed Project Solution

Application Name	**Weakness**	**Proposed Project Solution**
Descript	Focuses only on editing and post-production; no episode planning support	PodCraft provides automated topic research, structured planning, and complete episode outlines before recording
Buzzsprout	Only supports hosting and distribution; lacks content preparation tools	PodCraft assists in pre-production planning through intelligent agents that generate questions, hooks, and timestamps
Notion	Manual planning tool with no intelligent automation	PodCraft uses autonomous AI agents to automatically convert ideas into structured episode plans
ChatGPT	General-purpose AI requiring repeated prompts; no structured workflow	PodCraft provides a dedicated podcast-planning workflow with specialized agents for each task

5. Vision Statement

For podcast creators and content producers **who** need faster and more efficient ways to plan structured and engaging podcast episodes. **The** PodCraft **is** an agentic artificial intelligence-based podcast planning system **that** autonomously researches topics, generates interview questions, creates engaging hooks, assigns timestamps, and organizes complete episode structures. **Unlike** manual planning methods and general content tools that require scattered effort and repeated user input. **Our product** provides a fully integrated intelligent agent workflow that automates podcast preparation and improves content quality while saving time and effort.

6. Advantages / Benefits of Proposed System

The proposed system offers several advantages over existing podcast planning methods and tools:

1. **Time Efficiency:** Automates research and planning tasks, significantly reducing episode preparation time.
2. **Improved Content Quality:** Provides structured episode outlines that ensure logical flow and professional presentation.
3. **Audience Engagement:** Generates compelling hooks and organized discussions that help retain listeners.
4. **Automated Topic Research:** Identifies relevant and trending topics based on podcast niche and guest profile.
5. **Reduced Manual Workload:** Eliminates the need for scattered tools and repetitive manual content preparation.
6. **Consistency Across Episodes:** Maintains uniform structure and planning quality for all podcast productions.
7. **Multi-Platform Accessibility:** Supports both web and smartphone platforms, allowing flexible usage.

7. Scope

The scope of PodCraft includes the design and development of an intelligent podcast episode planning system that operates on both web and smartphone platforms. The system focuses on assisting podcast creators during the pre-production phase by automating research and planning activities. Users will be able to provide podcast niche details or guest information as primary inputs. The system will analyze this input to determine audience interests and content direction. PodCraft will include autonomous agents responsible for topic discovery, and background research. The system will generate structured interview questions tailored to the podcast theme and guest expertise. It will also allocate estimated timestamps for each segment to improve episode time management. An intelligent module will create engaging hooks and introduction suggestions to capture listener attention. The system will organize all generated content into a coherent and professional episode outline. Users will be able to review, edit, and export the generated episode plan. The platform will provide a simple and user-friendly interface suitable for both beginner and professional podcasters. PodCraft will support secure user authentication and cloud-based data storage for saving episode plans. The system will not include audio recording, editing, or publishing features, as those functions belong to post-production tools. It will not replace podcast hosting platforms but will complement them by improving preparation efficiency. The project is limited to automated planning and structuring rather than full podcast production. The system boundaries focus strictly on intelligent content preparation

and workflow automation. Overall, PodCraft aims to enhance productivity and planning quality within the defined pre-production scope.

8. Modules

The proposed project consists of multiple modules categorized according to system platforms.

8.1 Client Web Application

Module 1: User Authentication & Profile Management

- FE-1: User registration and secure login
- FE-2: Profile creation and podcast niche selection
- FE-3: Manage guest profiles and episode history
- FE-4: Secure cloud storage of user data

Module 2: User Intent & Guest Analyzer

- FE-1: Accept podcast niche input
- FE-2: Accept guest professional background details
- FE-3: Analyze audience interests and content direction
- FE-4: Generate content planning recommendations

Module 3: Topic Research Agent

- FE-1: Discover trending podcast topics
- FE-2: Collect background information related to niche
- FE-3: Identify audience-relevant discussion themes
- FE-4: Provide summarized research insights

Module 4: Question & Timestamp Generator

- FE-1: Generate structured interview questions
- FE-2: Categorize questions by segment type
- FE-3: Allocate estimated timestamps to each segment
- FE-4: Balance discussion flow across the episode

Module 5: Hook & Intro Suggestion Agent

- FE-1: Generate attention-grabbing opening hooks
- FE-2: Provide multiple introduction tone options
- FE-3: Customize hooks based on target audience
- FE-4: Suggest episode titles

Module 6: Episode Outline Planner

- FE-1: Organize content into logical episode flow
- FE-2: Divide episode into structured segments
- FE-3: Provide editable episode templates
- FE-4: Export outline in PDF or document format

8.2 Client Mobile Application

Module 1: Mobile User Dashboard

- FE-1: View saved episode plans
- FE-2: Quick input for niche or guest details
- FE-3: Real-time synchronization with web platform

Module 2: Quick Plan Generator

- FE-1: Generate episode outline instantly
- FE-2: View summarized topic research
- FE-3: Access pre-generated questions and hooks

Module 3: Plan Editing & Export

- FE-1: Edit episode structure
- FE-2: Modify timestamps and segments
- FE-3: Export plan to mobile storage or share

8.3 Admin Web Application

Module 1: User Management

- FE-1: Manage registered users
- FE-2: Monitor user activity
- FE-3: Suspend or remove accounts

Module 2: Content Monitoring

- FE-1: Monitor AI-generated content quality
- FE-2: Manage flagged or inappropriate content
- FE-3: Maintain system content standards

Module 3: System Configuration

- FE-1: Manage AI agent configurations
- FE-2: Update topic research sources
- FE-3: Monitor system performance

9. System Limitations / Constraints

LI-1: The system depends on internet connectivity for topic research and cloud data storage.
LI-2: AI-generated content may require manual review to ensure accuracy and relevance.
LI-3: The system does not support podcast audio recording or editing features.
LI-4: Podcast publishing and distribution are outside the system scope.
LI-5: Topic research accuracy depends on available online information sources.
LI-6: Real-time trend analysis may be limited by data access restrictions.
LI-7: The system performance may vary depending on device specifications and network speed.

10. Software Process and Design Methodology

The Incremental Software Development Process will be used for the development of PodCraft. This methodology allows the system to be built and delivered in small functional modules rather than as a single

complete product. It enables early testing of individual components such as research agents and planning modules. The incremental approach reduces development risk and allows improvements based on user feedback. This methodology is chosen because the project involves multiple intelligent modules that can be developed and integrated step by step.

11. Data Gathering Approach (Requirements Gathering Techniques)

The requirements for PodCraft will be collected using multiple data gathering techniques. Interviews will be conducted with podcast creators to understand their workflow and planning challenges. Questionnaires will be distributed to content creators to gather quantitative data about common preparation difficulties. Observation methods will be used to study how podcasters currently plan episodes using existing tools. Online research will also be performed to analyze podcast production trends and user expectations. These approaches help ensure that the system requirements align with real user needs.

12. Tools and Technologies

Table 2 — Tools and Technologies for Proposed Project

	Tools	Version	Rationale
Tools and	Visual Studio Code	1.85	Integrated Development Environment for coding
	MongoDB	7.0	NoSQL database for storing user data and episode plans
	Firebase	10.7	Cloud authentication and real-time database services
	Figma	116.9	UI/UX design and mockup creation
	Postman	102.1	API testing and backend service validation
	GitHub	Latest	Version control and team collaboration
	Google Chrome	Latest	Web application testing
	Android Studio	2023.1	Mobile app development environment
	Microsoft Word	365	Documentation
	Microsoft PowerPoint	365	Project presentation
	Microsoft Visio	2019	System diagrams and modeling
	Trello	Latest	Project management and task tracking
	Technology	**Version**	**Rationale**
	Python	3.11	Backend development and AI processing
	Javascript	ES6	Frontend and backend scripting

Technologies	Typescript	5.3	Type-safe frontend development
	React JS	18.2	Web frontend framework
	React Native	0.72	Cross-platform mobile app development
	Node JS	20.10	Server-side runtime environment
	Express JS	4.18	Backend web framework
	OpenAI API	Latest	AI content generation and intelligent agents
	REST API	V1	Communication between frontend and backend
	HTML5	Latest	Web page structure
	CSS3	Latest	Styling and responsive design
	Tailwind CSS	3.4	Modern UI styling framework
	JWT	Latest	Secure user authentication
	Cloudinary API	Latest	Media storage and optimization

13. Project Stakeholders and Role

Table 3 — Project Stakeholders for Proposed Project

Project Sponsor

COMSATS University Islamabad, Islamabad Campus

Stakeholders and Roles

Stakeholder	Roles and Responsibilities
Students (Development Team)	Design, development, testing, documentation, and deployment of the project
Project Supervisor	Provide technical guidance, monitor progress, and approve project phases
Final Year Project Committee	Evaluate project quality, documenting, and final implementation
Podcast Creators (End Users)	Provide requirements and feedback for system improvement
System Administrator	Manage system operations, users, and AI services

14. Module Based Work Division

Table 4 — Team Member Work Division for Proposed Project

Student Name	Reg. No.	Responsibility

Awais Ashraf	FA23-BDS-053	Client Web App Development - User Authentication, Dashboard, Episode Planner UI
Awais Ashraf	FA23-BDS-053	Admin Panel, Testing, Documentation, Deployment & System Security
Asna Hammad	FA23-BDS-051	Backend Development - APIs, Database Management, User Profiles, Cloud Integration
Asna Hammad	FA23-BDS-051	AI Agent Development - Topic Research Agent, Question Generator, Hook Generator

PodCraft — Agentic AI Podcast Episode Planning System

Project Category (Major Domains):

B - Web Application / Web Application based Information System

C - Problem Solving and Artificial Intelligence

E - Smartphone Application

Other: Agentic Artificial Intelligence System

Abstract

PodCraft is developed to simplify and automate podcast episode planning using intelligent autonomous agents.

Currently, podcasters rely heavily on manual research, scattered online sources, and unstructured planning methods, which consume significant time and often reduce content quality.

Many creators struggle to organize episode flow, prepare engaging questions, and design strong introductions that retain audience attention. This leads to inconsistent production quality and inefficient preparation workflows.

There is no unified intelligent platform that autonomously plans podcast episodes based on niche and guest information.

PodCraft addresses this gap by using autonomous agents to research topics, generate structured questions, create engaging hooks, and design complete episode outlines. The system aims to automate preparation, improve episode structure, and assist creators in producing professional content efficiently. It also enhances time management by providing timestamped segments and guided content flow.

The project ultimately enables podcasters to focus more on creativity and delivery rather than planning logistics. PodCraft improves productivity and raises the overall quality of podcast production through intelligent automation.

1. Introduction

This project proposal document presents the design and development scope of PodCraft, an agentic artificial intelligence system for podcast episode planning. The purpose of this project is to develop a smart platform that assists podcasters in preparing structured and engaging episodes with minimal manual effort. Podcasting has grown rapidly as a medium for education, entertainment, and professional communication across the world. However, planning a podcast episode requires extensive research, structured thinking, and careful time management. Many content creators struggle with organizing discussion flow, preparing meaningful questions, and designing engaging introductions. The process becomes more difficult when inviting guests from specialized fields, as hosts must understand the guest's background and audience interests. Existing tools only provide basic note-taking or script-writing features but lack intelligent automation and planning support. Modern artificial intelligence systems now enable autonomous decision-making and content generation through agent-based architectures. PodCraft utilizes this technology to provide intelligent research, content planning, and episode structuring support. The system operates through specialized agents that collaborate to produce a complete episode plan. These agents analyze user intent, research relevant topics, generate interview questions, suggest engaging hooks, and organize content flow. The proposed system aims to modernize podcast planning by combining artificial intelligence automation with creative assistance.

2. Problem Statement

Podcast content creators spend a significant amount of time researching topics, analyzing guest backgrounds, and structuring episode flow before recording. This preparation process is often unorganized and depends heavily on manual internet searches, personal notes, and scattered digital tools. Creators frequently struggle to identify trending and relevant topics that match their podcast niche. Preparing meaningful and engaging interview questions requires deep understanding of the guest's expertise and audience expectations. Many podcasters also face difficulty in organizing episode segments and managing time distribution effectively. As a result, episodes may become inconsistent, poorly structured, or less engaging for listeners. Creating attractive introductions and hooks is another challenge that directly affects audience retention. Current podcast planning tools mainly offer simple text editing or script writing features but lack intelligent research and automated structuring capabilities. There is no integrated system that autonomously converts a podcast idea into a complete episode plan. The absence of intelligent planning support increases workload and reduces creative efficiency. This problem becomes more significant for independent creators and small production teams with limited resources. Additionally, inefficient planning leads to longer preparation time and delays in publishing schedules. The growing demand for high-quality content makes manual planning methods insufficient. Therefore, an intelligent automated system is required to simplify podcast episode preparation and improve production efficiency.

3. Problem Solution / Objectives of the Proposed System

The proposed system, PodCraft, introduces an intelligent agent-based platform that automates podcast episode planning. The system allows users to provide their podcast niche or guest information as input. A User Intent and Guest Analyzer agent interprets this input to determine content direction and audience expectations. A Topic Research Agent collects relevant themes, trending discussions, and important background information related to the niche or guest. The Question and Timestamp Generator agent produces structured interview questions and assigns estimated time durations for each
